1 PROBLEM GATE 1997 CS Q1

The probability that it will rain today is 0.5. The probability that it will rain tomorrow is 0.6. The probability that it will rain either today or tomorrow is 0.7 What is the probability that it will rain today and tomorrow?

2 SOLUTION

let X_0 be an event of raining today, X_1 be an event of raining tomorrow.

Given that

Probability that it will rain today

$$\Pr(X_0) = 0.5 \quad (2.0.1)$$

Probability that it will rain tomorrow

$$\Pr(X_1) = 0.6 \quad (2.0.2)$$

Probability that it will either today or tomorrow is

$$\Pr(X_0 + X_1) = 0.7 \quad (2.0.3)$$

We have to find the probability that it will rain today and tomorrow which is

$$\Pr(X_0X_1) \quad (2.0.4)$$

we know that

$$\Pr(X_0X_1) = \Pr(X_0) + \Pr(X_1) - \Pr(X_0 + X_1) \quad (2.0.5)$$

On Substituting the values in (2.0.5)

$$\Pr(X_0X_1) = 0.5 + 0.6 - 0.7 = 0.4 \quad (2.0.6)$$

So, therefore the probability that it will rain today and tomorrow is 0.4.
