1 PROBLEM GATE 1997 CS Q1

The probability that it will rain today is 0.5. The probability that it will rain tomorrow is 0.6. The probability that it will rain either today or tomorrow is 0.7 What is the probability that it will rain today and tomorrow?

2 SOLUTION

Let X be two random variable taking two values 0 and 1(Bernoulli random variable).

X_0 be an event of raining today and X_1 be an event of raining tomorrow.

Given that

Probability that it will rain today

$$\Pr(X_0) = \frac{1}{2} \quad (2.0.1)$$

Probability that it will rain tomorrow

$$\Pr(X_1) = \frac{3}{5} \quad (2.0.2)$$

Probability that it will either today or tomorrow

$$\begin{aligned} \Pr(X_0 \cup X_1) &= \Pr(X_0) + \Pr(X_1) - \\ \Pr(X_0 \cap X_1) &= \frac{7}{10} \quad (2.0.3) \end{aligned}$$

we have to find the probability that it will rain today and tomorrow which is

$$\Pr(X_0 \cap X_1) \quad (2.0.4)$$

from (2.0.3)

$$\Pr(X_0 \cap X_1) = \Pr(X_0) + \Pr(X_1) - \Pr(X_0 \cup X_1) \quad (2.0.5)$$

Substituting the values gives

$$\Pr(X_0 \cap X_1) = 0.5 + 0.6 - 0.7 = 0.4 \quad (2.0.6)$$

So, therefore the probability that it will rain today and tomorrow is 0.4.
